Anatomy of the Foramen Magnum Area

Surgical anatomy of foramen magnum

- F M ~ located in the occipital bone
- Three parts of occipital bones :
 - 1 – Squamous part – Contain F M
 - 2 - Basal (clival) part – Ant. to the FM
 - 3 - Condylar part - Connects the squamous CB and clivus
- **Oval shaped**, wider posteriorly than anteriorly
- Narrower anterior part sits above the odontoid process
- Wider posterior part transmits the medulla

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Medulla oblongata

Dorsal surface

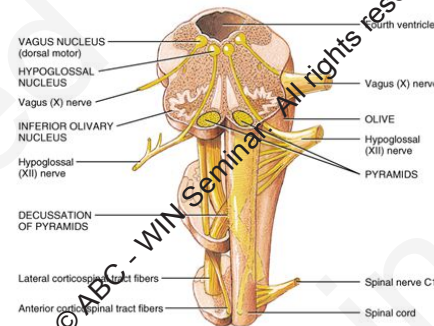

Lower portion

- ❑ **Gracile tubercle:** produced by underlying gracile nucleus
- ❑ **Cuneate tubercle:** marks the site of cuneate nucleus
- ❑ **Inferior cerebellar peduncle**
- ❑ **Obex**

Upper portion: forms the lower half of rhomboid fossa

Ventral Surface of Medulla Oblongata

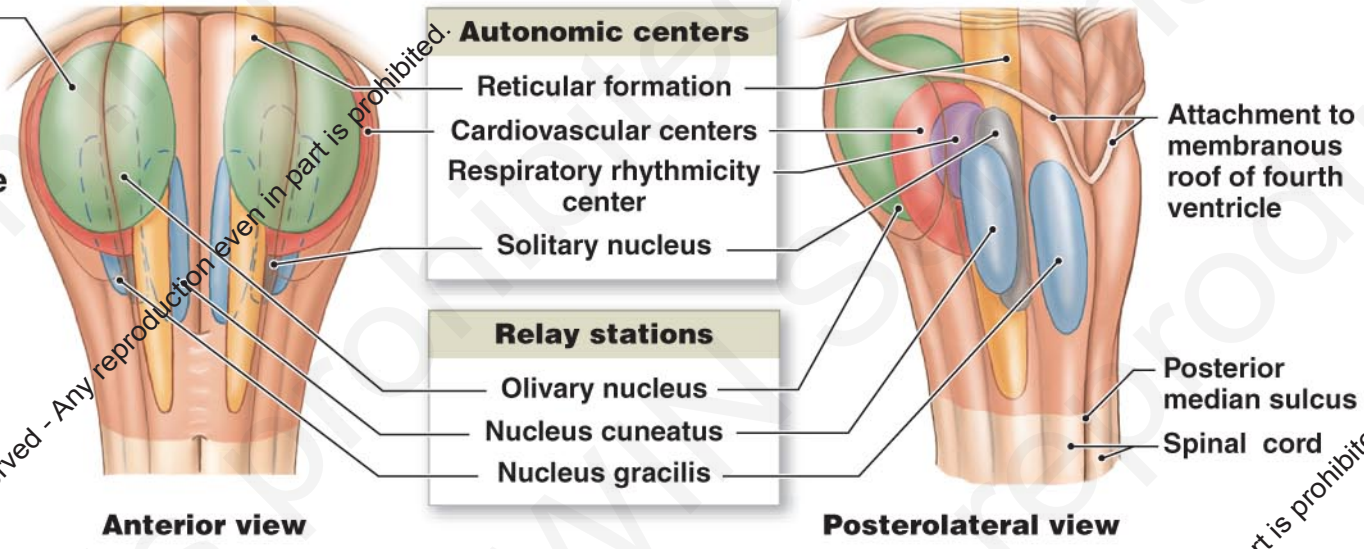

- Ventral surface bulge
 - pyramids
 - large motor tract
 - decussation of most fibers
 - left cortex controls right muscles

Structure of the medulla oblongata

Two views of the structure of the medulla oblongata showing its landmarks and structures

- | Autonomic centers | |
|--------------------------------|--|
| Reticular formation | |
| Cardiovascular centers | |
| Respiratory rhythmicity center | |
| Solitary nucleus | |
| Relay stations | |
| Olivary nucleus | |
| Nucleus cuneatus | |
| Nucleus gracilis | |

TELENCEPHALON (CEREBRUM)

- Conscious thought processes, intellectual functions
- Memory storage and processing
- Conscious and subconscious regulation of skeletal muscle contractions

DIENCEPHALON

THALAMUS

Relay and processing centers for sensory information

HYPOTHALAMUS

Centers controlling emotions, autonomic functions, and hormone production

MESENCEPHALON (MIDBRAIN)

- Processing of visual and auditory data
- Generation of reflexive somatic motor responses
- Maintenance of consciousness

METENCEPHALON (CEREBELLUM)

- Coordinates complex somatic motor patterns
- Adjusts output of other somatic motor centers in brain and spinal cord

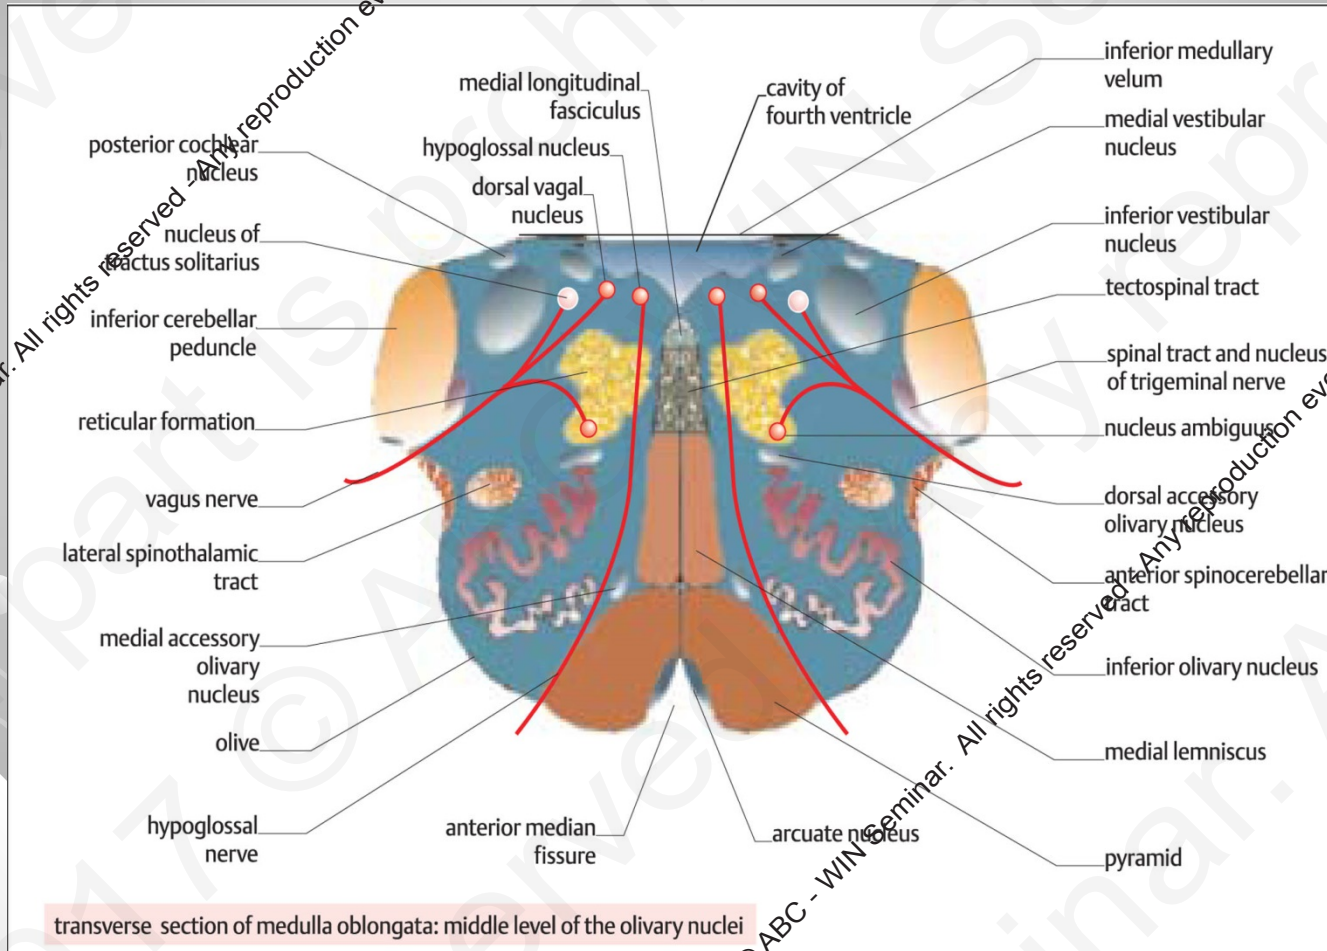

METENCEPHALON (PONS)

- Relays sensory information to cerebellum and thalamus
- Subconscious somatic and visceral motor centers

MEDULLA OBLONGATA (MYELENCEPHALON)

- Relays sensory information to thalamus
- Autonomic centers for regulation of visceral functions such as cardiovascular, respiratory, and digestive activities

Postoperative Studies

Vascular Tumors of the CV Junction

- **Mostly Intradural:**
 - > **Meningioma**
 - > **Schwannoma (CN XII)**
 - > **Hemangioblastoma**
 - > **Metastatic Tumors**
- **Mostly Extradural:**
 - > **Chordoma (rarely vascular)**

Tumors According to the Location of Development, and Relationship to the Vertebral Artery

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Angiographic Work Up

- **Not Needed for small tumors with well defined vascular anatomy by MRI /MRA**
- **Vertebral Artery:**
 - **Size, Dominance and Collateral Circulation;**
 - > **? Encasement;**
 - > **?PICA ; ?Anterior Spinal Artery**
- **Venous System:**
 - > **Sigmoid sinus/ Jugular Bulb?**
 - > **If occluded, collateral Circulation?**

Endovascular Embolization: Helpful when Near Complete

- **ECA Branches:**

- > **Ascending Pharyngeal Artery :**

use large **Polyvinyl Alcohol particles 250 to 350 microns**

- > **Occipital Artery branches- watch for anastomosis with the VA**

- > **Vertebral Artery Branches:**

- > **Rarely Embolizable: High risk of reflux; often, multiple small branches**

- > **Onyx®**, or **nBCA** may be used

- > **We have only used particles**

Foramen Magnum Meningioma: Types

- **Superior - Inferior Extension:**
 - > Predominantly above the FM (Lower clival)
 - > At the FM to C1-2
 - > Below the Foramen Magnum (down to C3)
- **Lateral Extension:**
 - > Mainly Lateral
 - > Anterolateral (majority)
 - > Mainly Anterior (rare)
- **Consistency:**
 - > Soft (Rare); Firm and fibrous (common); Calcification
- **Vascularity:**
 - > High Vascularity indicates a WHO Grade 2 or 3 tumor

FM Meningioma: Risk Factors

- **Size** : Small ≤ 2 cm; Medium 2 to 3.9 cm; Large ≥ 4 cm
- **Arterial Encasement**: VA (one or both), PICA; Anterior Spinal Artery. Perforating Branches
- **Invasion of Major Veins**: Anterior Spinal Vein
- **Spino Medullary Brain Invasion**: Flare Signal on MRI \pm
- **Cranial Nerves** : 9 -11; 12
- **Prior Surgery or Radiotherapy**
- **Hydrocephalus**
- **Tumor Consistency and Vascularity**

Preoperative Work Up

- **Audiogram**
- **Voice and Swallowing Evaluation**
- **MRI Scan**
- **CT with bone Windows**
- **Angiography for large and artery encasing lesions**
 - **VA, Sinuses, Jugular bulb, collaterals**
- **MRA and MRV for smaller lesions**
- **Embolization (PVA) for vascular lesions**

Anesthesia and Monitoring

- **Total Intravenous Anesthesia**
- **Cranial Nerves 7,8,10, 11,12**
- **SSEPs**
- **MEPs**

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

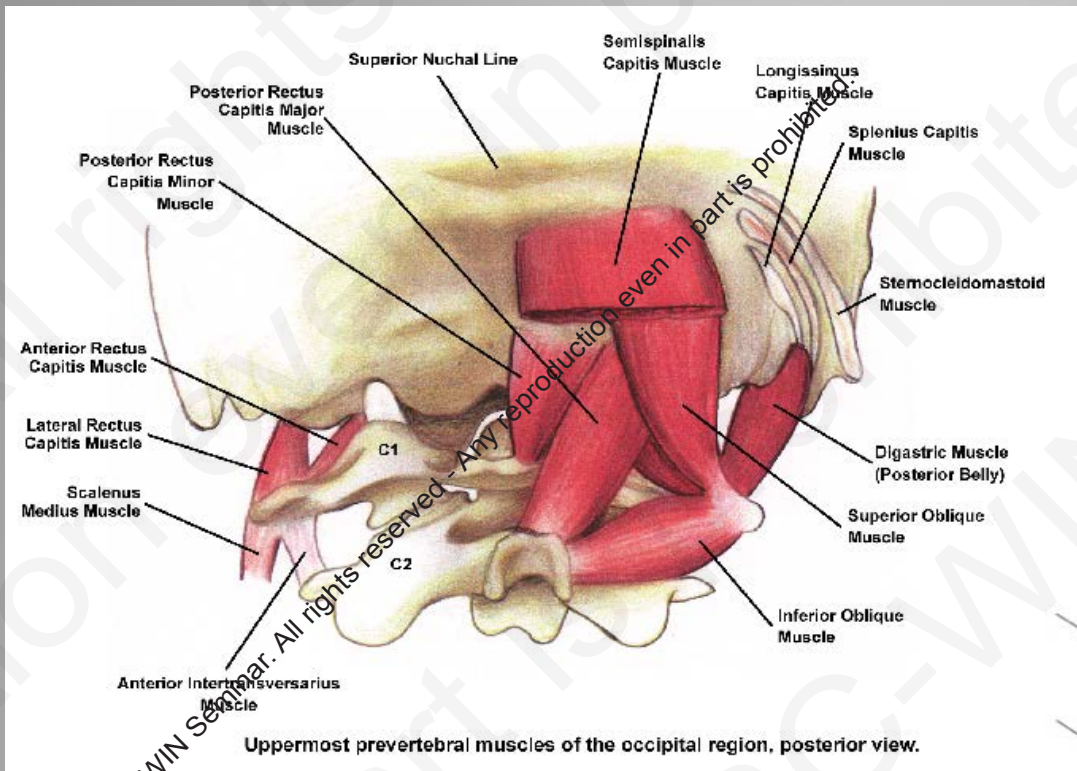

Operative Approach

- Tumors are Rarely Posterior to the Cord
- Antero- lateral or Anterior location
- So, the Approach:
 - > Postero- Lateral: (Extreme Lateral, Retro condylar)
 - > Lateral: (Extreme Lateral, Partial Trans condylar); Occipito- cervical fusion Rarely needed
 - > Anterior Approach (Trans Oral): Not used; High risk of CSF leak, All the relevant anatomy not exposed

ANATOMY OF MUSCLE LAYERS

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Spinal Accessory Nerve

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Patient Position

- **Supine with a Roll, Head Turn -**

- > **Lateral Approach Combined with Petrosal, or**

- > **Need for Radial Artery/ Saphenous Vein Extraction**

- ★ **C1 rotates on C2, stretches VA, may occlude it (dominant VA especially)**

- **Check for excessive Neck rotation with Retrograde Jugular Bulb Pressure, Trans cranial Doppler, and MEPs**

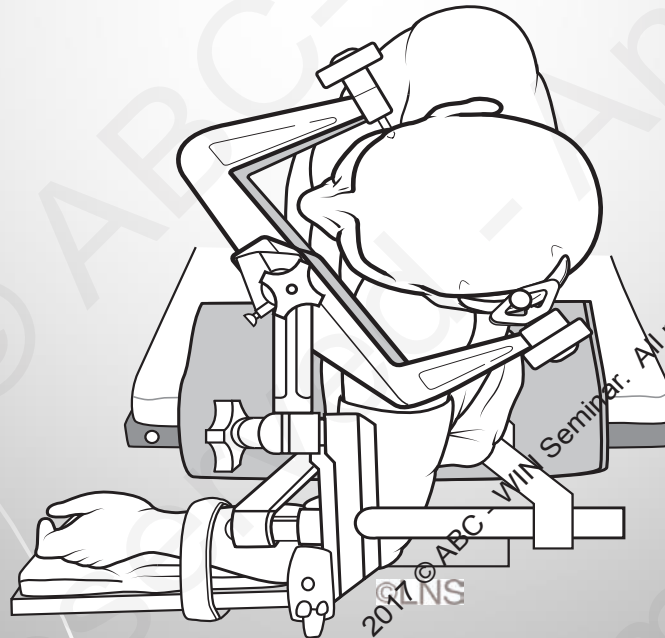

- **Lateral –**

- > **Better Position; less risk of VA Occlusion**

- > **RAG Taken from Upper Arm or SVG from Lower Leg**

- > **Intraoperative Angio can be done with insertion of Arrow Femoral Sheath**

Preferred Position: Lateral

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

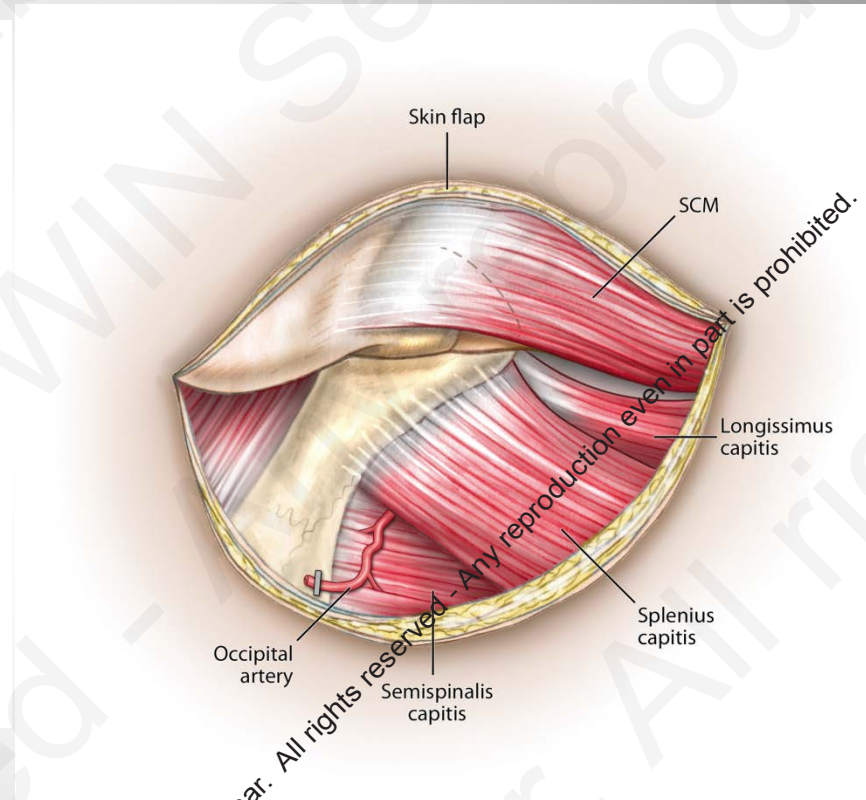

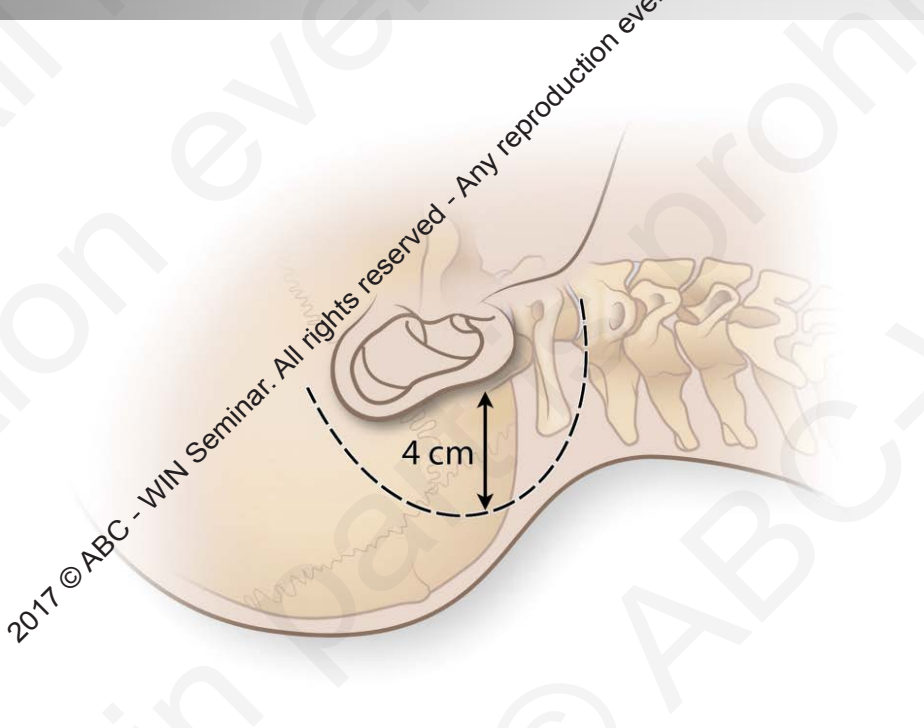

All rights reserved. Any reproduction even in part is prohibited.

Incision and First Layer

- A C- shaped Incision is preferred to an inverted U-shaped incision
- Skin elevation usually with the SCM
- SCM can be separately reflected inferiorly for lesions lower than C2
- Below C2, Spinal XI crosses from SCM to Trapezius, needs to be identified and preserved

Incision and First Layer

Second And Third Layer

- **Second Layer:** Splenius Capitis Reflected Posteriorly
- **Third Layer:** Semispinalis Capitis, and Longissimus Capitis Reflected Inferiorly
- **Landmarks :** Mastoid Tip, and C1 Transverse Process are Important Landmarks ; Are Palpated Now

Second and Third Layer Off

Fourth Layer

- Superior and Inferior Oblique cut and reflected medially from C1 Transverse Process
- Longissimus Cervicalis may be reflected inferiorly
- Rectus Capitis Major Elevated from Suboccipital Bone
- Lamina of C1 palpated, VA venous plexus visible
- VA identified deep to the venous plexus at C1, or between C1 and C2 (C2 nerve root)
- Venous bleeding may be controlled with bipolar cautery and fibrin glue

How to find the Vertebral Artery

- **C1-C2 (Terminal V₂ Segment) :**
 - > **C2 root crosses lateral to it**
 - > **Longer segment, often more easily found**
 - > **Deep to Longissimus Cervicalis Muscle**

- **Superior to C1 (V₃ Segment) :**

- > **Venous Plexus**
- > **Sub occipital Triangle Muscles**
- > **Bony Groove on C1 lamina**
- **Micro Doppler, Navigation (altered anatomy)**

V3 Exposure; Retro condylar Approach

V2-3 Exposure
VA Translocated;
Partial C1-Occipital Condyle Resection
In Vertical Line with Mastoid Tip

CN XI, XII, and Intradural VA

Anterior Spinal Artery

Dural Closure

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

VA Translocation; Surrounding Anatomy

Dural Incision

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Craniotomy and Laminectomy

- **Sub occipital Craniotomy incl. Foramen Magnum for Cranial Cases**
- **Mastoid Bone Drilled to expose the Medial edge of the sigmoid sinus**
- **CN 7 runs deep and anteriorly, can be found by finding the lateral semicircular canal, or the digastric groove ;
Not Necessary to Expose it**
- **Lateral half laminectomy C1 to C3
for spinal and Foramen Magnum cases**

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Dural Opening;
No VA Translocation

VA Translocated;
Contralateral VA Seen

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Closure

- **Fascial Graft or Dural Substitute** must be used to close the defect, suture circumferentially
- **Suture Dural Graft to VA** using the periadventitial cuff of tissue
- **Fibrin Glue**
- **Muscles must be reapplied anatomically to allow vascularized closure**
- **Ventriculostomy in case of redo operations, Hydrocephalus**
- **May need Trapezius flap if muscles atrophic**

Foramen Magnum Meningioma: Why Do An Extreme Lateral Approach?

- **Early Devascularization of Tumor**
- **Brain Stem / Spinal Cord manipulated minimally**
- **Total Tumor Resection with the Dura (Simpson Grade 1) Is Possible In Most Primary Cases**
- **Local Recurrence Is Rare After Total Microsurgical Removal**
- **CSF Leak is Rare**
- **Direct Proximal Control of the VA (contralateral VA can be exposed intradurally)**

Transfacetal Approach: Lesions from FM to C3

- **Facet removed up to the foramen transversarium**

- **VA unroofed if needed**

- **Hemi laminectomy**

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

Foramen Magnum Meningiomas

- A Partial Tran condylar Approach is indicated when the tumor is Anteriorly placed to the Spinal Cord and Medulla
- A Retro condylar Approach may be performed when the tumor is Lateral to the Spinal Cord and Medulla
- A Complete Trans Condylar Approach is Rarely Needed; so an *OC Fusion is Rarely necessary*

Summary of HMC Cases (2005-2016, surgeon LNS)

- **Total cases** n=21 (F=14, 66.6% ; M=7, 33.3%)
- **Mean age** 58.6 yrs (Range 14-78)
- **Mean symptom duration** 23.6 months (Range 0.25 -120)
- **Lower Cranial nerve involvement**, n=5 (23.8%) ;
Hydrocephalus, n=6 (28.5%)
- **Family history** of cranial meningioma ,n=3 (14.2%);
Extraneural malignancy ,n=2 (9.5%)
- **Mean Preop KPS** 71.8 (Range 50 – 90)
- **Location;**
 - Lateral Extension**
 - Central**, n=11 (52.4%)
 - Centrolateral / Lateral** ,n=10 (47.6%)

Rostrocaudal Extension

Predominantly above FM, n=15 (71.4%)

Predominantly below FM, n= 6 (28.6%)

- **Artery Encasement**, n=4 (19%)

Vertebral artery, n=4 (19%)

PICA , n=2 (9.5%)

- **Tumor Sizes;**

Small, <2cms; n=6(28.6%)

Medium, 2-3.9cms; n=9(42.8%)

Large, >4cms; n=6(28.6%)

Mean maximum tumor size 3.34cms

- **Preop EVD**

n=6 (28.6%)

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

- **Approaches**

Far Lateral , n=14(66.6%)

Extreme Lateral , n=7(33.3%)

(Transcondylar n=19, 90.4% ; Retrocondylar n=1,4.7% ; Transfacetal n=1,4.7%)

- **Mean surgery duration 8.2 hours (Range 5.1- 12.25)**

- **Mean estimated blood loss 415ml (Range 100-1200)**

- **Resection**

Gross Total, n= 16(76.2%)

Near total (small residue) ,n=5(23.8%)

- **Postoperative complications**

Wound infection , n=1(4.7%)

CSF leak , n=1(4.7%)

Pseudomeningocele , n=1(4.7%)

Lower CN palsy worsening , n=4(19%)

Tracheostomy , n=2(9.5%)

Occipitocervical instability, n=1(4.7%)

Extracranial Vertebral Artery Injury (N=1, Successful repair)

- **WHO Grade**

Grade I ,n=19 (90.5%)

Grade II atypical, n=2 (9.5%)

- **Recurrence, Eventual Death (WHO Grade 2 Tumor) , n=1(4.7%)**

> Re Operation (Operated Elsewhere; Operated at HMC; Recurred after 2 years; Neuraxis Metastasis; Death)

- **Adjuvant Radio therapy , n=2(9.5%)**

- **Mean Postop KPS 84.2 (Range 60 – 90)**
- **Mean Follow-Up 62.1 months (Range 8-132 months)**
- **Death** in one patient due to progressive tumor growth and cervicomedullary compression (WHO II, Operated outside & Referred to HMC following rapid recurrence)

Endovascular Management

Summary

- **Preoperative Embolization** n=8 (38%)
- **Vascularity**; Hypervascular 3(14.2%) ; Hypovascular 5(23.8%)
- **Major Feeders**:
 - Ascending pharyngeal, n=8(38%)
 - Sphenopalatine, n=7(33.3%)
 - Middle meningeal, n=7(33.3%)
 - Occipital, n=6(28.6%)
 - Vertebral, n=4(19%)
- **Feeder Embolization**:
 - Ascending pharyngeal, n=8(38%)
 - Sphenopalatine, n=1(4.7%)
 - Vertebral, n=1(4.7%)
- **Embolization agent** used ; PVA particles in all cases and gelfoam in one case

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

Partial Transcondylar Approach

- **Posterior 1/3rd to 1/2 of Occipital Condyle and Lateral Mass of C1 removed**
- **Allows approach anterior to VA entrance and Spinomedullary junction without brain stem retraction**
- **VA can be dissected completely, mobilized posteriorly**
- **Better View of VA-Basilar Junction**
- **No fusion needed**
- **Dura is opened with cuff around VA to allow closure**
- **Dentate ligaments and C1 rootlets are divided after dural opening**
- **Be Careful at VA dural Entrance, Spinal 11 Nerve**
- **Main Window Of Operation Is From CN XI to C2 Rootlets**
- **Careful Closure Needed to Avoid CSF leakage**

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Lower Clival Meningioma: Presenting with Hemorrhage

- **48 / F**
- **Lower Cranial Nerve Symptoms,
Diplopia, Headache: 1 Week**
- **Exam: Bilateral CN 9 & 10, Right CN 6
Palsy**
- **Preoperative Karnofsky 60**

PREOP CT & MRI 10/7/2005

Hemorrhagic Lower Clival Tumor

Preoperative Angiogram & Embolization: Bilateral Occipital Arteries with 250-350 micron PVA;

Ascending Pharyngeal with 350 -500micron particles

Left Occipital

Right Occipital

Right Occipital – Retro mastoid Branch

Ascending Pharyngeal

Left Fac lateral Transcondylar Approach,
Mastoidectomy, Microsurgical Total Resection
of Lower & Mid-Clinical Membranes
Condyle Partially Removed

Surgery: Extreme Lateral Partial Trans Condylar Approach Complete Resection of a Hemorrhagic, soft Tumor

Postoperative: Worsened CN 9,10 Palsy
Tracheostomy, Gastrostomy,
Pneumonia, Recovered

Follow Up, at 2 Years:
Near Complete recovery of CN Deficits
Karnofsky 70
No recurrence

Postoperative MRI 10.29.2005
Pathology: meningioma WHO Grade 1

Follow Up CT Scan

Case 3

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Case Summary

- 50 / man
- History: Numbness of lower extremities, slight arm weakness
- Jehovah's Witness (cannot take blood)
- Exam: Numbness both lower limbs; Slight weakness Right Upper Limb; Broad Based gait
- MRI: Large Lower Clival Meningioma
- Operation: Total Resection by Far Lateral Retro sigmoid Approach; Encasement of PICA, and Perforator arteries
- Postoperative : Sinus Thrombosis left; Pseudo Meningocele: Lumbar Drainage 5 days; Anti coagulation for 6 weeks
- Complete Recovery, Sinus Recanalized

Mid and Lower Clival Tumor

No Encasement Seen
On Angiogram:
But PICA and Perforator
found Encased at Surgery

Pre embolization

ECA run Post Embolization

Coils placed in Occipital Branch;
Embo with PVA 150 -250 microns

Vertebral Artery Injury (C 3 Segment)

OPERATIVE SKETCH

Left extreme lateral transcondylar approach, Total microsurgical tumor resection,
Repair of laceration of the vertebral artery

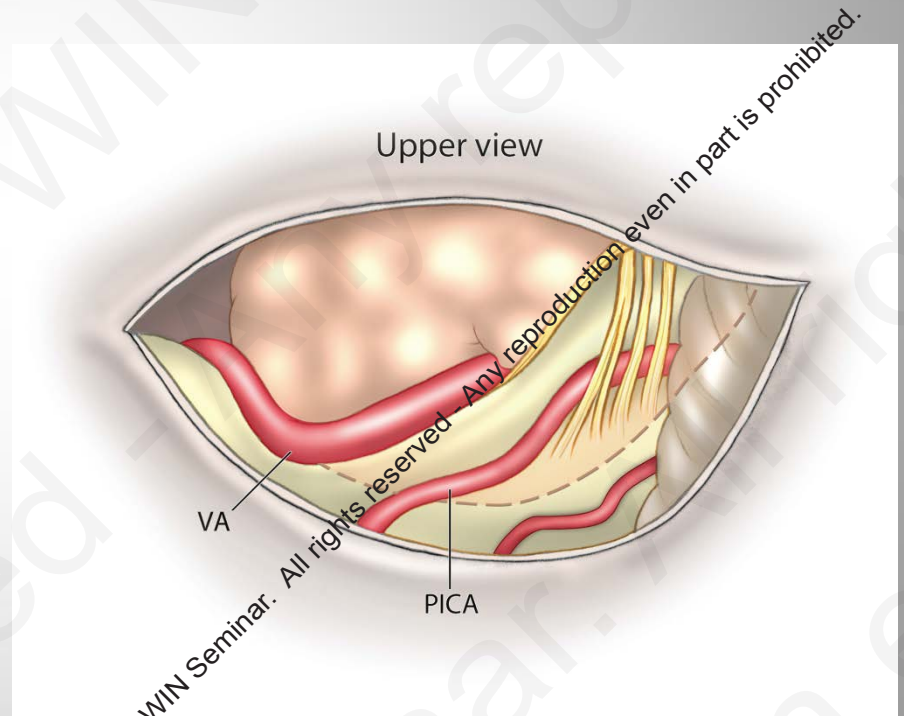

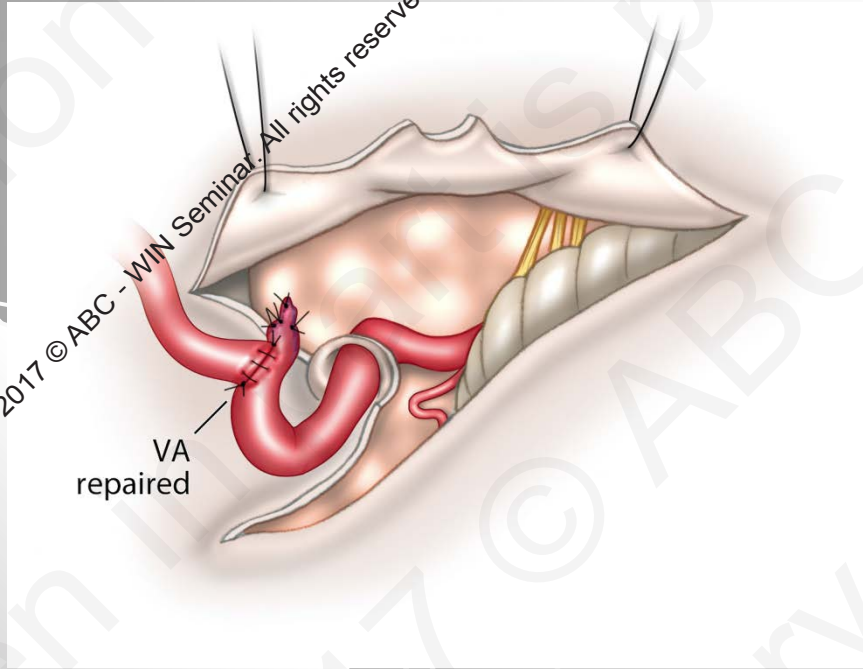

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

2017 © ABC - WIN Seminar. All rights reserved - Any reproduction even in part is prohibited.

Extreme Lateral Partial Trans Condylar Approach

Hypo plastic VA lacerated and transected during the exposure

Repaired by Resuture after Mobilization

Postoperative MRI

Patient recovered Without Deficit

No recurrence after 4 years

2017 © ABC - WIN Seminar. All rights reserved. Any reproduction even in part is prohibited.

Recurrent Meningioma VA Occluded Previously

- 65 Year old Lady
 - Previous Partial Tumor Resection
 - Poor Condition, Tracheostomy, Quadriplegia
 - Transferred For Further Treatment
 - Complete Tumor Resection

Postoperative Vasospasm

Severe Deterioration On Postop Day 13

CT Scan Bilateral cerebellar Infarcts
Postop Day 15

Cerebral Vasospasm Discovered,
Angioplasty on Postop Day 16

Patient Did not Improve

Recurrent Foramen Magnum Meningioma: VA encased by scar and tumor; Replacement With SVG

Complete Tumor Resection SVG in Place

OCCIPITOCERVICAL INSTABILITY

63/F

Asymptomatic growth of
Meningioma Over a 7 year Period

NO Neuro Deficits

Preop KPS 80

No preoperative Embolization

- Approach from Left in view of brainstem distorted and tilted to the Left Side
- But Tumor extended across to the Right side, necessitating a more anterior approach, with more Condyle and C1 resection

Left Extreme lateral trans condylar approach, Left Retrosigmoid craniotomy, Mastoidectomy, C1 laminectomy, Complete Tumor Removal

Immediate Postop CT Scan showing excessive resection of Left occipital condyle and C1 lateral mass causing **Severe Persisting Neck Pain and Tilt**

Neck Tilt Seen

Notice the Extent of OC and C1 lateral Mass removal

Postop X ray & CT showing Occipito-Cervical fusion

Occipito Cervical Fusion 1 month after the Original Surgery
Symptoms Completely Resolved

Postop CT C –Spine showing Occipito-Cervical fusion

Neck Symptoms Relieved completely
Gross total resection
Postop KPS 90
WHO I
No recurrence
F/U 2 Yrs

Hemangioblastoma

- **Two Cases**

- **One was in a Patient with Von Hippel Lindau Disease**

 - > Patient with VHL: Multiple tumors and recurrences within a short time

 - > Died Eventually, after surgery due to brainstem edema

- **The Second Patient.....**

Large Medullary and Cervical Cord Intrinsic Hemangioblastoma

- 37/M
- Progressive R hemiparesis – 6 months
- Exam: R hemiparesis 4/5; Bilateral Hyperreflexia
- KPS 60
- MRI: Cervicomedullary Hemangioblastoma
- Angiogram – Fed by Anterior and Lateral Spinal Arteries
- Embolization
 - > PVA embolization of feeders from Lateral Spinal Artery
 - > Not really Helpful

Embolization of Lateral Spinal Artery

Surgery

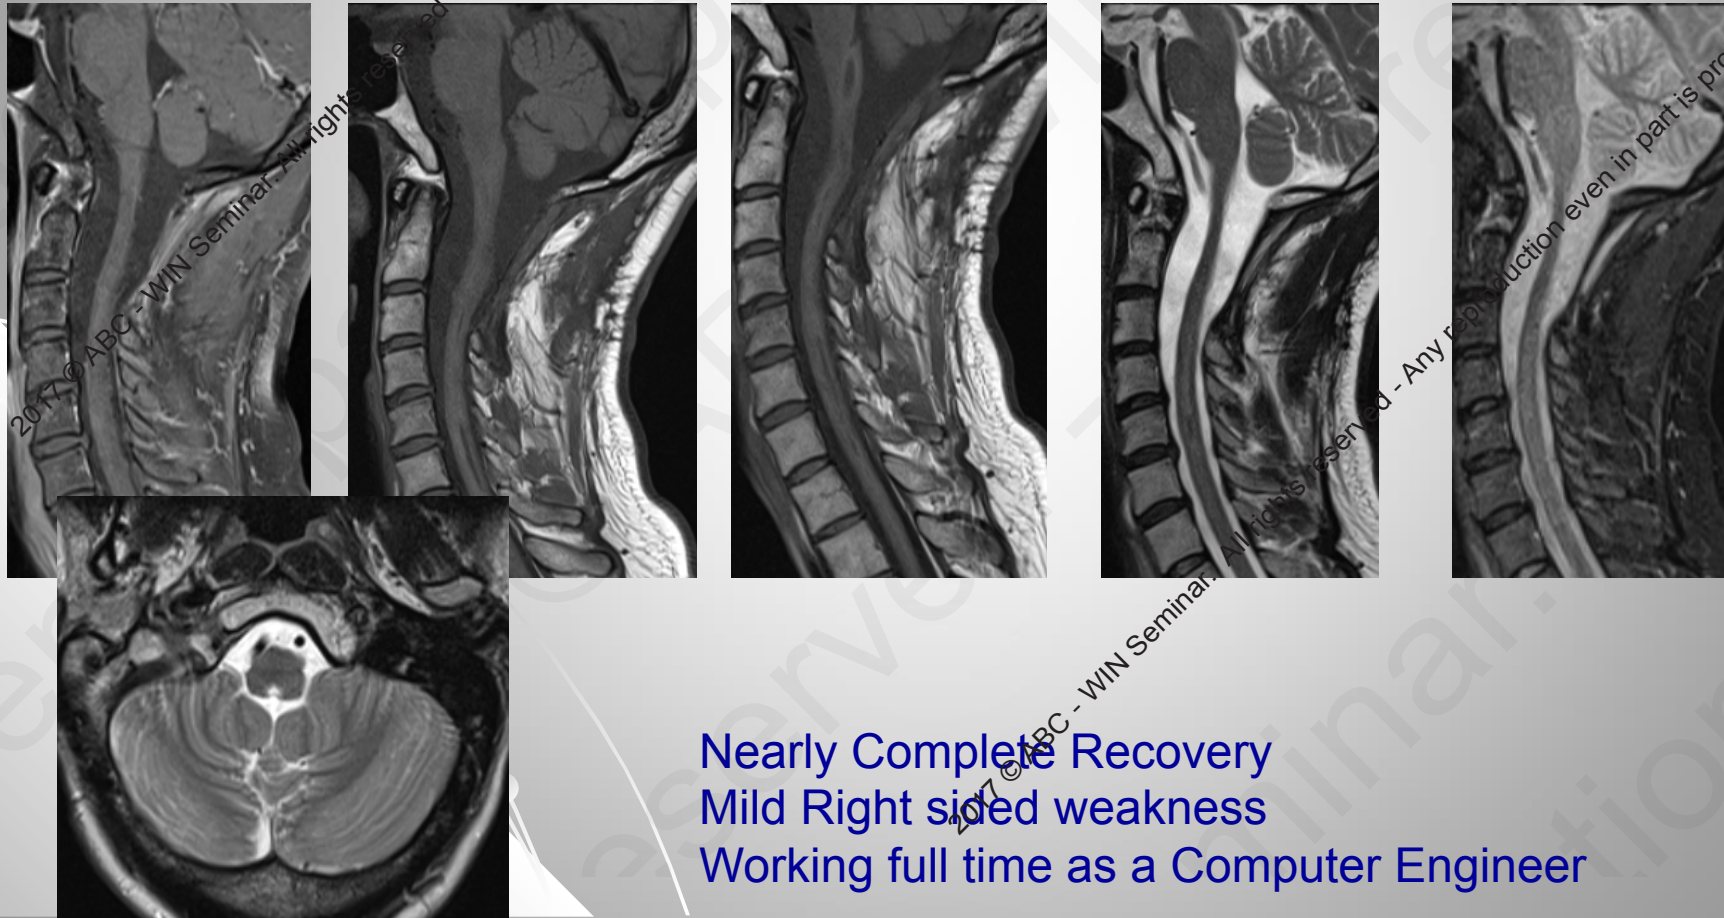

- **Far Lateral Approach**
- **C1-3 Laminectomy**
- **Lateral Decubitus Position with Right Side Up**

**MICROSURGICAL
EXCISION OF
CERVICOMEDULLARY
HEMANGIOBLASTOMA**

Follow Up MRI 1/6/2016 (after 23 months)

Postop Comp:
hyponatremia and
postural hypotension
KPS 90
F/U 23 months

Nearly Complete Recovery
Mild Right sided weakness
Working full time as a Computer Engineer

Chordoma

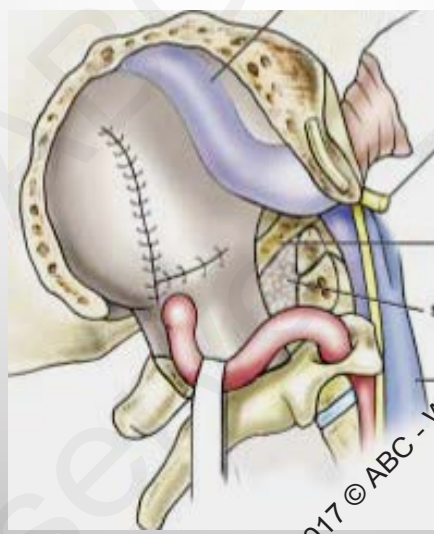

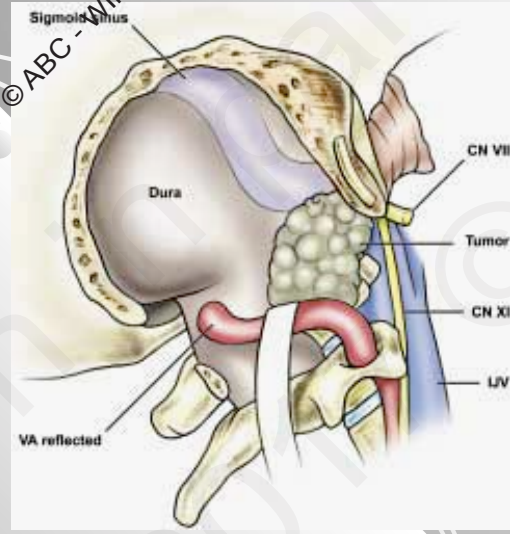

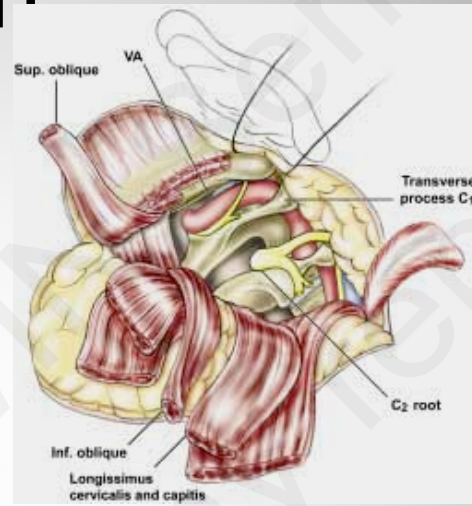

- Foramen Magnum Chordomas are about 1/4th of Cranial Chordomas
- One or Both VAs may be encased
- Extreme Lateral, Complete Trans Condylar Approach is Used for Resection
- Generally, the Vertebral Artery Can be Dissected Free of Tumor

5y/o Girl, Severe neck and shoulder pain, and Inability to keep head up straight, Inability to eat, Dragging of both feet, particularly the right side

Sekhar Score: 22 , Karnofsky : 40

2 and 1/2 years after treatment

Small Tumor residue at C 2 Level

No Recurrence after 4 years
Follow Up Karnofsky 100 Sekhar Score: 1

Conclusions

- **Vascular Tumors of the Foramen Magnum Area can be safely removed surgically**
- **Embolization is helpful to reduce bleeding and too reduce the duration of surgery (study in progress)**
- **A very good understanding of the Anatomy of the region, and of the blood vessels is needed**
- **A Lateral Approach provides excellent exposure, and allows complete removal with minimal complications in most cases**
